

Service Orchestration

We implemented choreography in the last chapter while implementing the distributed sagas pattern. In the booking service only, a sort of (because not fully compliant SEC) custom SEC was implemented, where the booking flow was implemented using event choreography. However, it can also be implemented using orchestration. In this chapter, we'll make use of Netflix Conductor to understand orchestration and dig more deeply into it.

We'll explore the following topics in this chapter:

- Choreography and orchestration
- Orchestration implementation with Netflix Conductor
